

THERMAL CONDUCTIVITY OF GASES

Marcia L. Huber

The following table gives the thermal conductivity of some common gases as a function of temperature. Unless otherwise noted, the thermal conductivity values refer to a pressure of 100 kPa (1 bar) or to the saturation vapor pressure if that is less than 100 kPa. The notation $P=0$ indicates that the low-pressure limiting value is given. The difference between the thermal conductivity at 100 kPa and the limiting value is generally less than 1 %. Uncertainties for gases in this table are generally less than 3 %; uncertainty information on specific fluids can be found in the references. Thermal conductivity is given in units of $\text{mW m}^{-1} \text{K}^{-1}$. Substances are listed in the modified Hill order.
